Deadline for manuscript submissions:

**31 August 2020**

### Message from the Guest Editors

Pre-requisite for the sustainable management of natural resources is the availability of timely, cost-effective, and comprehensive information on the status and development trends of the management object. Remote sensing has always been an essential source of such information. Remote sensing researchers are often aiming for purely academic objectives, thus lacking support and guidance from practical forestry, which influences the quality of scientific exercises.

The focus in this special issue is on the development of algorithms for forest site characterization, wood characterization, biomass and CO<sub>2</sub> stocking, mapping forest conditions, ecosystem vulnerabilities, socioeconomic functions and conditions, as well as on the operationalization of remote sensing for natural resource management through the integration of scientific research and its practical utilization. Review contributions are also suitable for the Special Issue.

This Special Issue is linked with H2020 project MySustainableForest, however, contributions from other researchers are very welcome.

Prof. Dr. Gintautas Mozgeris
